There are some good and bad things about the shutdown. Like many Mac users, I had migrated to Snow Leopard for the promise of a better Mac operating system and a lot of incremental improvement. I was sold on the promise of the little things: speeding up the OS, eliminating pop-up windows, and so on. Unfortunately, the true lesson of Snow Leopard is "what happens on your Mac, stays on your Mac." ***What makes a leaky bucket useful?***

A leaking bucket keeps things from all leaking out. The UI from Adobe is the important part of the Mac ecosystem. It occupies the space where you interact with your Mac. If it's wretchedly bad, it drives users away from the Mac because the experience is so uncomfortable. If Adobe continues to make the Mac a not-so-good experience, that will only lead to more users migrating to Apple. A leaking bucket can't be used for more than about 1/2 of the water that it can hold. When it comes to development tools, Adobe's Photoshop has always been a wonderful package. It's been a cornerstone of professional and amateur photographers' tool packs for many years. As we already know, the usage of the software is now supporting the growth of the industry and the new edition has managed to gather even more fans thanks to the features and improvements that have been added. If you are not a professional photographer, let's start our review with a simple question: "Why should you use Photoshop?" The first thing that comes to mind is that the software is an absolutely great image editor. It's especially effective when creating photo montages, placing several images into one file, or stitching them altogether. You can easily create custom templates, develop your own customized brushes and adjust your images straightforwardly. As the software is not limited to editing images, you can easily use it to create slideshows, posters, animated sequences or even more complex projects. This is definitely the most popular reason to use Photoshop.

Wikipedia - Adobe Photoshop You may need to crack up to explain the impact of this announcement to your colleagues and peers — but it's a major undertaking, with an estimated development cost of \$1 billion (which gives you a sense of where the industry is going). And yet, when viewed from the right perspective, this is a \$1 billion investment in a way to bring the power that Photoshop can offer to creators and designers who crave tools that can do the heavy lifting in many cases. Over the last three years, Chrome has been working to empower web applications that want to push the boundaries of what's possible in the browser. One such web application has been Photoshop. The idea of running software as complex as Photoshop directly in the browser would have been hard to imagine just a few years ago. In an interview with Macworld, Photoshop team leader Chris Reilly listed a few items to keep an eye on in the future:

- *Native GPU access*: With the introduction of the Apple silicon for Macs, the team is working with Apple for an all-new vector graphics API (DNG) and shader-based communications protocol to establish native GPU access to Photoshop. This technology has been available in other products for a decade, and it's a positive sign that Apple and Adobe want to bring the feature to Photoshop.
- *Open layers*: To reduce the need for supporting an increasing array of low-level details in the

underlying GPU APIs, the team looks to the wider vector graphics stack.

Get started on building your own Lightroom presets in the upcoming Adobe Lightroom CC 2020 update. In this tutorial by Jeffrey Rudell, you'll learn how to build custom presets to use in Lightroom and Photoshop back using the proprietary Adobe Preset Manager file. There's a lot of speculation about Adobe's future involving the anticipated launch of Photoshop and the newer native GPU APIs introduced by Apple. The latter, in particular, is exciting for Mac users, who have long demanded that Photoshop use the native APIs and not the older single-threaded applications that have been used in the past. With that in mind, how are those changes changing the look of the product, and is it making an impact on the direction of the product? The team has been busy testing native GPU access and is actively working on both macOS and Windows releases. Looking ahead, he noted that the team is mindful of its users' needs and wants a product that "just works", and that it is planning to make sure that the Photoshop experience is consistent between platforms. That means, as one example, that it will remove limits on the number of layers with masking.
