Lightroom 5 is a full-featured solution. Of course, it has its drawbacks, the most important one being that it still requires a connection to the Internet for certain operations. You can't, for example, use Lightroom to edit JPEG files saved from the web and then later save the edited JPEGs to the web, because Lightroom cannot store edited JPEGs without internet access. You can, however, save edited JPEGs locally to your hard disk. This is important, since you can now group photos from different sources. As such, you can now, for instance, edit a photo you came across online and then crop it locally. You can also move photos you've edited locally to the web. That doesn't do much for you if you're just uploading photos for printing and publication, though. The tools to upload images to services like Facebook or Dropbox are fairly lacking in Lightroom – again, such services still require the Internet. Since the release of Lightroom 4, I have been primarily shooting with the Nikon D5100 and lately my D3300. I do use the D3300 more than I use the D5100 when it comes to serious photo work. I find it to be a true photo professional's camera and, more importantly, I'm choosing it because it's the ultimate in image quality. Moreover, the fact that it's really inexpensive and comes in small and lightweight makes it ideal for travel. But Lightroom is a decent, powerful photo management solution for experienced users who want a fully-featured tool. It's probably the best of the current crop of software, and I'm glad it was included as part of the recent suite.

It can also work with your RAW files to help you edit those photos. It allows you to control the colours of your image. This layer is formed by having a number of settings. You can create a group of tools or effects which you can set to trigger together. For example, setting a blur and skew together and activating the noise filter at the same time. These tools are named as independent tools and the settings of these tools are independent as well. You can create a filter group and name it. 2. Blend Modes: Blend modes allow you to change the colour on the image as per your requirement. Before you expose the colour, which you want, you can blend it. Once you blend it, you can see the colour which you want. Blend modes combined with the Adjustment layers are outstanding. 3. Colour Panel: This panel is found in the top left edge of your Photoshop window. It is a colour picker with RGB and HSL options. You can get the colours of your image, which you can use to edit the colour of your image. 4. Content Aware Fill: This is the tool which is used to fill the portions of the image with the content in the surrounding area of the photo. You can also specify the type of content. For example, if you want the photo to have the logo or take the photo out of the paper stop and instead use the photo of the businessman and let his name fill the region. You can also replace the content.
