EbookNetworking.net : Allows you online search for PDF Books - ebooks for Free downloads In one place. Russia Will Be the Country With Highest Lifetime Radiation Risk - UN Report 20 July 2014 Russian residents are likely to be exposed to five times higher dose of radiation than their Western counterparts over the course of their lifetime, according to a new report by the United Nations Scientific Committee on the Effects of Ionizing Radiation (UNSCEAR). Between 2000 and 2005, they were exposed to four times higher dose than Japanese people, and 3.5 times higher than the global mean, UNSCEAR said. The report was published by the United Nations Scientific Committee on the Effects of Atomic Radiation (UNSCEAR) on July 11. The report recommends that the Japanese government should remove as many as 50,000 people from the severely contaminated areas and relocate them to other parts of the country. The number of people exposed to above 1 millisievert per year should also be reduced as much as possible, the report said. It is classified as a high-level radiation dose for long-term effects and a low-level one for short-term effects. In contrast, about 80 percent of the global population will be exposed to a dose below the national level of 0.3 millisieverts per year, UNSCEAR reported, adding that the world average is 0.15 millisieverts per year. Japan's dose is 0.09 millisieverts, among the lowest in the world, with the European Union at 0.23 and the United States at 0.65, the UNSCEAR report said. The report emphasized that evidence from cancer patients and from various experiments showed that radiation and radionuclide exposures increase the risk of cancer, including cancer of the thyroid and leukemia. Based on the cancer statistics, UNSCEAR concluded that children would be the most vulnerable population among the general public in terms of cancers and other diseases. About 34,000 deaths are caused by radiation exposure every year, according to the report. Deaths resulting from radiation exposure may also increase in the future due to the natural aging population and the increase in the number of hospital patients, the report said. Over 2.5 million people in Japan have been exposed to radiation of more than 50 millisieverts over 40 years, and more than 1.8 million of these people live near the Fukushima plant, the report f988f36e3a
