Anyone who has worked in Photoshop knows what Photoshop Camera RAW is about. The new version, version 10, allows you to save the raw files as DNG format. It's now easier to open the resolution you need and make custom adjustments such as Levels, Sharpen, Contrast, and entire Layers at once. It's also possible to reuse custom settings like a Lens Correction to help make future adjustments easier. In addition, it's a lot easier to adjust objects now. Prior to the upgrade, you had to first select an object and then click the Edit button to access a new window in which you could move, rotate, or resize the object. Now you just click the Edit button, and the object is selected automatically. The new version of Photoshop, 20.2, brings with it a number of exciting new features and enhancements. Notable among them, you can use the AI feature within Photoshop to optimize images to fix common problems. If those fixes don't do the trick, you'll be able to correct any remaining artifacts in an image using the new noise reduction tools, including an all-new "Blur Gallery" view. Since Photoshop is an image editing program, you should always plan in advance how the resizing and cropping process will affect your image. This is especially true for huge images with a high resolution. For example, if you're working with an image measuring 2,500×3,500, you have to be sure that you will be able to crop it to its desired proportions before starting the resize process. You can't crop after sewing images together, even if you try to do it while manually renaming them.

The Eyedropper is one of the essential tools to have. When creating work for websites and online identities, the Eyedropper is extremely useful. Let's say you want to be orange in the way that people would see it. Using the Eyedropper allows you to add this solid orange color to your image without any problems. It works like the magic wand of your work. Simply use the Eyedropper to pick up color from the screen and place it in your image. Now you can add color as you wish and play with it until you find exactly what you're after. **What It Does:** The Clone Stamp tool removes unwanted objects from your photos. It is great for removing red eyes, scratches, blinking lights, hair, and a huge list of other things. While you're removing an unwanted object from your image, you can add shapes and color to the areas it's removed. While you can add color to the areas that you want your object to be in your image, you will need to select a new color and fill it in. 933d7f57e6
