Saving and exporting of the 5D Mark II has been improved in the Lightroom 5.0 release but you must know that you must separate your image and video files using an underscore and they must be placed under a separate folder. Hello, have been a long time reader of your site and I am in the middle of my photography education in photoshop landscape. As many others I am a bit skeptical about performance and the pricing option. I'm wondering if the price includes LR. Could you please tell me if that is the case and if it does what is the price difference in dollar? Or is that just for the Authorition plugin?

Thank you for your help. Greetings. I am well aware of the issues with software developers not being familiar with the photo editing and workflow (painting, etc) world. But I don't understand some of the negative or critical reviews that are posted. The people using and reviewing the program should at least have a basic knowledge of how to use it. Shall I go as far as to say that if you don't know rudimentary photo editing workflows, don't use this program? I know at one time or other I used both Lightroom, Luminance and Photoshop, and the process may be somewhat different, but the workflow is still almost identical. Especially with the numerous options that can be changed from time to time. What I am looking for is a reason why someone would write a zero star rating, but not give a reason. Also, if critique is available, ie. add a comment to the average of the image, I always like to see what others are seeing due to the different hardware available and the different versions of the software. For example, we know that most monitor refresh rates are 240 to 300 Hz. A medium

speed computer would lower the shutter speed and the frame rate, but good light control, lens selection and exposure compensation will almost always keep things right in the middle. So, when I take a photo, the shutter is probably open 3 to 5 ms and the frame rate is most likely 60. The camera is doing the rest. But, the computer has to process it. If your monitor is not set to 60 Hz, there is a problem. If your monitor is too slow, everything that is not slick looking will look like the photo is turned sideways. If your monitor is too fast, everything will appear smooth. Accordingly, I shoot RAW and have it stored along side the jpeg. I also have the original and a print to be able to tell what is wrong with the photo when so many are asking me to confirm they are seeing what I am. Even when using an uncalibrated monitor, a large percentage of photographs I take are underexposed. So, you are mixing apples and oranges. I am not saying the jpeg is the way to go, but it is very good. On the whole, I have been very happy with Photoshop. I will say I have tried most (but not all) of the programs that are available, but not to the extend of being pro so that may be why having worked for a living for 30 years, I'm not too critical. Sorry for rambling. Have an amazing day. Peace, Florence

Features: The Clipping Mask tool lets you edit and manipulate your images seamlessly. You can easily remove background, reveal hidden elements or blend layers together. It has a powerful set of editing tools that you'd expect from a professional photo editor like Adobe Lightroom. **What It Does:** The Gradient tool lets you easily create a gradient that fades from one color to another. It's a very handy tool for simple color gradient effects, but it can be a little tricky to use. For instance, you can use the Gradient tool to create a simple color fade that works on a layer, but you can't really edit it once it's done. Still, there is some power when it comes to creating interesting gradients. For example, the Gradient tool lets you create radial or arc gradients, which will give your content an organic look. If you'd like to create a smooth gradient that works on the layer itself, you can use the Gradient tool to do that. You can also make a gradient with a custom color and create radial or arc gradients by using this custom color. I use Photoshop to take pictures.
